The application should be reviewed for errors.

To conform with standard practice and for the sake of clarity, independent claims should be amended to start with --The-- and dependent claims to start with --A--.

Also for the sake of consistency, claims 3 and 4 should be amended to read "serine protease".

The amendment filed 3/17/02 is acknowledged. Claims 1-9 and 12-16 are being considered on the merits.

The amendment filed 3/17/02 is objected to under 35 U.S.C. 132 because it introduces new matter into the disclosure. 35 U.S.C. 132 states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows:

No clear basis or support is found in the present specification for the changes to the specification in the paragraph beginning at page 3, two lines from the bottom. Applicants did not indicate the reasoning behind the changes or the basis therefor.

Applicant is required to cancel the new matter in the reply to this Office Action.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Claims 1-9 and 12-16 are rejected under 35 U.S.C. 102(a) as being clearly anticipated by Dawson *et al.* (WO 99/10519).

The claims are directed to the hydrolysis of a substituted-2-azabicyclo[2.2]hept-5-ene-3-one, wherein the substituent is acyl, alkoxycarbonyl or aryloxy carbonyl, using a hydrolase such as an acylase and the subsequent reduction of a product.

Dawson *et al.* teach the hydrolysis of at least racemic tert-butyl-3-oxo-2-azabicyclo[2.2]hept-5-ene-3-one and 2-acetyl-2-azabicyclo[2.2]hept-5-ene-3-one using a hydrolase such as acylase with an effective amount of nucleophile and base at constant pH. See, e.g., Examples 2 and 4, wherein the nucleophile is water, the base is contained in the phosphate buffer and the pH is constant at 8.0. The optically active compound of formula II is inherently

produced. The reference teaches the subsequent reduction thereof in Example 3 using a metal hydride. The enzyme used, i.e., savinase is a serine protease and is the same as subtilisin.

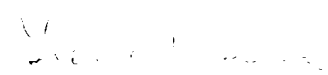

Thus, the claimed invention as a whole was clearly *prima facie* obvious, especially in the absence of evidence to the contrary.

No claim is allowed.
